AVOCATEC
MR.BRENT BAIDEN
Present.

According to the tests made in a typical kiln with your assistance in the installation and correct mounting of magnetizers that we bought to AVOCATEC , after long tests and calculations.

We noted a 37° C, increase in temperature inside the kiln,considering that the increase took place after we applied magnetizers on the gas pipe. This increase in temperature let us slow the gas flow and we saved 7% on consumption. So we consider magnetizers as on option to save gas.

Let me know if you have any questions or need any comment about the tests conducted in our plant.

Regards
